Stadium

Stormwater treatment

TUBO steel tanks for stormwater retention

880 m³

The new academy was built in 2018 and Pureco - being in the designs of the water-related part of the development - has the chance to participate in this fascinating project. The steel tanks are arming round the football field providing perfect stormwater retention to avoid grass-damages to be caused by heavy rainfalls. This reference is a complex one: not only tanks, but small oil separators and shafts were also provided to the project.

retention / against effect of the climate change / complex solution / large capacity / environment friendly attitude
