Stormwater treatment

Corrugated steel pipes

1,200 m³

1200 m³ corrugated steel pipes had been installed in NEXEN TIRE Plant in the Czech Republic that came into operation in 2018 and as a main production base of NEXEN TIRE in Europe for global production system. It produces 12 million units through phased extension.

Corrugated steel pipes are effective solutions for treating storage rainfall from paved surfaces, from parking area in this particular case. Tubular sections are connected by watertight hinges, while the body is retained by the rubber seals in the casting. During the installation of pipes, we have been present all the time on site, with great emphasis on the quality of the filling material and the compression, as the flexible steel structure passes the load to the filling around it.
